

Miss Marple 2010: The Highlights

When you choose Miss Marple, you choose Europe's leading software asset management (SAM) solution with more than ten years of proven success behind it. Miss Marple offers integrated state-of-the-art license management, taking into account IT assets, licenses, contracts and the actual utilization of the software installed. The new Miss Marple 2010 makes license management even easier, faster and more precise.

There is one important need that license managers expect from a license management solution: fast and correct results. Miss Marple has been developed even further based on this premise, and our years of experience have enabled us to integrate many useful and intelligent functions:

High level of automation

Thanks to intelligent routines, Miss Marple works with a very high level of automation. This saves time and costs while minimizing possible sources of error and work expenditure, substantially reducing the workload for the license manager.

Integrated license management

Miss Marple features comprehensive and modular design, even in its basic functions.

From the very beginning, you can view IT assets, licenses, contracts and the actual utilization of the software. Or you can expand your license management step by step – whatever you prefer.

Integrated best practice processes

Miss Marple adjusts to your expertise in license management. You can work with the integrated best practice processes or automatically and seamlessly integrate Miss Marple into your processes: For example, in the procurement process ranging from the demand trigger in an ERP system to the final replacement of software.

Automated server license management

The automated server license management features very detailed reading of the server information (e. g. number of users, instances, CALs). This enables the generation of proposals for license models which provide a huge saving potential in the cost-intensive server area. Miss Marple helps you to achieve a fast ROI.

Intelligent software catalog

Miss Marple's software catalog is not only extensive, it is also self-learning. It is expanded automatically; as a consequence, soft-

ware products are recognized in exact detail. Additional market-leading catalogs (Microsoft, Express Metrix) can be integrated as required.

Numerous interfaces for the integration of third-party systems

Miss Marple is able to acquire and present data from various third-party systems via standard mechanisms. This includes data from already existing inventory solutions. This means that Miss Marple can easily be integrated into your existing processes and systems.

License pooling

This function allows you to quickly identify and optimize licenses which are available but not in use.

Extensive rights management

The concept of rights and roles can be adapted to your enterprise structure covering all hierarchy levels, functions and even on data content level.

Trigger software procurement at the touch of a button

Thanks to the integrated license database, Miss Marple recognizes more than 40,000 license products from the 50 major software manufacturers worldwide. Interfaces to all commercially available ERP systems enable software procurements to be automatically triggered and allocated in Miss Marple as needed. The optimized acquisition of software licenses with Miss Marple is even easier for our customers thanks to our many years of partnership with international software resellers.

Multi-client capability

The sophisticated multi-client capability helps Miss Marple to fulfill the most important prerequisite for use in group structures.

Multi-language support

Miss Marple provides multi-language license management with a uniform user interface for multilingual enterprises.

Exact change history protocols

Miss Marple keeps detailed protocols about every change in a change log. All hardware and software changes can thus be tracked without omissions at any time.

Automatic reminder function

Miss Marple individually and automatically reminds you of appointments or informs you if thresholds are reached (KPI).

Expanded reporting functions

Intelligent BI dashboards and reports enable you to make highly flexible decisions with a very high degree of transparency. The integration of the Microsoft SQL database on client and server level provides an optimum platform for this purpose.
